

11 — ATLAS: the desk's day

Audience: end users, trainers, support — and engineers who need to know what a screen is *for*.

Companion docs: [04 Running flows](#) · [07 RBAC](#) · [12 VocX](#)

ATLAS is the web dashboard. It works on a laptop and on a phone — the desk genuinely uses it in the field.

1. The ten tabs

Tab	What it is for
Today	Your work queue: due and overdue lead actions, lender chases awaiting response, covenants due, and everything awaiting your approval
Dashboard	The whole book summarised — counts by stage, amounts in ₹ Cr, open intel by signal
Leads	Opportunities before they become deals. "Push to Deals" starts here
Deals	The company-centric view. The company drawer is where most day-to-day work happens
Lending	The credit pipeline, plus the LMS sub-view for serviced loans
Platform Deals	Syndication mandates, the lender matrix, chases and responses
Asset Monetisation	Asset sale mandates: teaser → discussion → offers → close
Masters	Clients · FI Master · Employees · Reconciliation
Activity	Activity log and Audit (Admin only)
Tools	Ledger import/export, News Radar, schedules, email

Not every tab is visible to every person — see §8.

2. Today — start here

The one screen a person should be able to work from all morning.

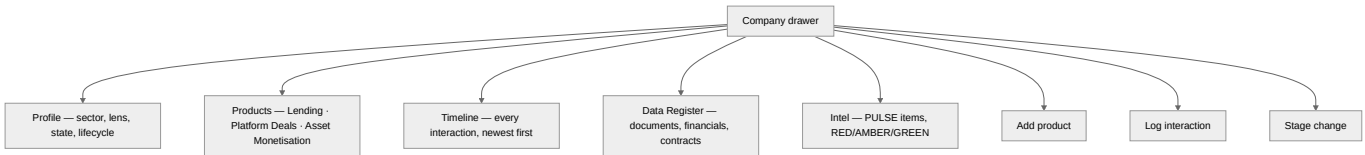

Section	Source
Lead actions due / overdue	Leads with a follow-up date
Lender chases awaiting a response	Syndication lender rows
Covenants due	The covenant monitor
Awaiting your decision	<code>GET /orchestrator/v1/workflows/pending</code>

That last one deserves emphasis: **the parked workflow run *is* the work item**. There is no separate task table to drift out of sync with reality. If a run is waiting for you, it is on your Today page; when you decide, the run moves.

The approval queue speaks the desk's language — a stage-change request shows the business words, not workflow ids.

3. Deals and the company drawer

Click a company row and the drawer opens. This is where most work happens.

Add product

Choose **Lending**, **Platform Deals** or **Asset Monetisation**, and give an amount in ₹ Cr.

- **Amount is mandatory and has no default.** A default of 2 was removed in v2.1 precisely to prevent silent data pollution.
- The row is created at a **starting status** — refine everything else in the drawer.
- If the company has no deal record yet, one is created automatically and the product flag set on it.

Log interaction

Files a timeline entry against the company, deal or line. VocX writes to the same timeline — a dictated interaction and a typed one are the same kind of record.

Stage change

The Target dropdown offers **only legal moves** from the current stage, read from the same transition map the server enforces. You cannot be offered a move that will be refused.

The lane is per-desk: an AM RM sees no lending stage-change button.

Close deal

Ends the deal and records **how** it ended:

Outcome	Means	Recorded as
Won	The deal was done	Closed Won
Lost	We wanted it and did not get it	Closed Lost
Dropped	We walked away — our own decision	Dropped

That distinction is the point. Collapsed into one word, the book could still say how many deals did not close, but not how many of those were Evam's own call.

A closing note is mandatory, and the close is **refused while the deal still owes answers** — open EWS cases, unresolved covenant observations, or product lines still mid-pipeline. The dialog names each blocker before you commit, and a deal cannot be closed out from under its own pipeline.

The button appears only for the stage-change approval authority (Admin, Management or a vertical Head), and disappears once the deal has already reached a terminal. Closing is final — a revived opportunity is a new deal.

4. The three product boards

Each is a grid with the same shape: filters, a search box, an export bar, and row click → the company drawer.

Board	Stage/status vocabulary
Lending	Data Awaited → Diligence → Note Circulated → Sanctioned → CP/CS Completed → Ready for Disbursement → Disbursed · plus Rejected / On Hold
Platform Deals	Deal Sourced → Docs Pending → IM in Prep → IM Circulated → Queries Received → IP Received → Sanctioned → Disbursed · plus On Hold / Withdrawn / Rejected / Dropped
Asset Monetisation	Teaser Prepared → Teaser Shared → In Discussion → NBO Received → BO Received → SPA / Documentation → Closed · plus Dropped

Platform Deals has **no Diligence stage** — that is Lending's vocabulary. The two are separate by design.

The lender matrix (Platform Deals)

A company × bank grid showing where each lender stands on each mandate.

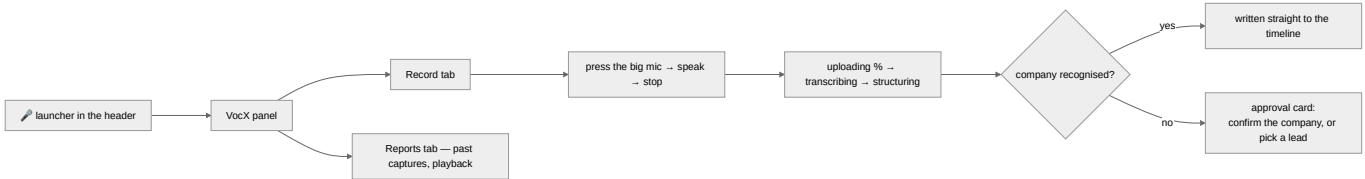

- **Full lender master by default**, with an "Engaged lenders" toggle to narrow to banks actually in play.
- A find-company box and a collapsible banks-in-play panel, so it scales past a demo book.
- Moves are **forward-only** with remarks; the bank's yes is called **"Approved"** in every view, consistently.
- The `Un-Assigned` state exists so a bank in the master is not implicitly "in the deal".

LMS (inside Lending)

For loans that have been booked: ledger entries, conditions, accrual and interest preview. `LMS Operator` posts routine events; `LMS Management` holds the hard-to-reverse verbs — booking approval, classification, closure, waiver authority.

5. VocX — recording an interaction

The mic in the header opens the VocX panel.

What a user should know:

- **Recording stops automatically at 3 minutes** and keeps everything recorded so far. Nothing is thrown away.
- **A new company creates a company and a lead.** Recording three separate conversations about a genuinely new company legitimately creates three leads — they are three opportunities, not a duplicate bug.
- **Speak the company name clearly and early.** Matching keys off it, and the priming vocabulary is built from the register's own names.
- **"VocX did not answer in time" does not mean the recording is lost.** The audio is archived before transcription begins. Retry.
- **A capture can be logged to a specific subject.** The "Log to" picker targets a lead, deal, lending line, syndication mandate or AM mandate.

6. Masters

Sub-tab	Contents
 Clients	The company master — every entity, its code, sector, lens, state, lifecycle
 FI Master	Banks, NBFCs, DFIs, funds — the counterparty master feeding the lender matrix
 Employees	The people directory and where roles are granted
 Reconciliation	The import quarantine queue

Employees — granting a role

1. Open the person, or **Add**.
2. The **Role** field is a multi-select — a person may hold several roles, and access is the maximum across them.
3. Save.

If a role change does not appear to take:

- The dialog now **reports a failure** rather than silently doing nothing. If you see no error, the change was applied.
- Allow up to the permission cache TTL (~30 s), or have the person sign out and in.
- Check the email matches their sign-in identity **exactly** — a mismatch means they sign in as a different identity with no grants.

Reconciliation

Rows the import could not write correctly land here rather than being written wrong or dropped.

Action	Who	Requires
Work the queue, view items	Admin or Management	—
Mark corrected	Admin or Management	The record must now actually pass validation — the system re-checks
Waive	Management only	A ticket reference

The asymmetry is intentional. An Admin may close an item that has been *fixed*; deciding that a record stays incomplete on the book is a Management call, and it leaves a ticket behind.

Each card shows the row "**as imported**" so you can see what the spreadsheet actually said.

7. Tools

Tool	What it does
Ledger	Import the desk's Excel, and export it back — a full round trip with no loss
News Radar	PULSE results: RED / AMBER / GREEN items per company, and a sweep trigger
Schedules	Recurring jobs
Email	Digest and notification settings

Importing a workbook

1. **Tools** → **Ledger** → **Import**, upload the `.xlsx` (up to 64 MB).
2. Read the result summary: rows written, rows updated, rows **quarantined**.
3. Go to **Masters** → **Reconciliation** and clear the quarantine.

Before importing, three things save a lot of time:

- **Company names must be spelled consistently.** The importer is entity-centric and matches by name — a typo creates a second company. Brackets and suffixes are fine; *inconsistency* is not.
- **Use the right vocabulary per sheet.** A Lending stage on the Syndication sheet will not map (`Diligence` does not exist there).
- **A stage with mandatory data needs that data.** A `Ready for Disbursement` lending row without a proposed disbursement amount and date will be quarantined, correctly.

8. What each role sees

`F` full · `S` scoped (your own rows) · `R` read-only · `—` hidden

Tab	Admin	Mgmt	BD Head	BDRM	Credit Head	Deal Analyst	Syn Head	Syn RM	AM Head	AM RM	LMS Op	LMS Mgmt
Today	F	F	S	S	S	S	S	S	S	S	S	S
Dashboard	F	F	S	—	S	—	S	—	S	—	—	—
Leads	F	F	F	S	—	—	—	—	—	—	—	—
Deals	F	F	F	S	S	S	S	S	S	S	R	R
Lending	F	F	R	R	F	S	R	R	R	R	R	R
Platform Deals	F	F	R	R	R	S	F	S	R	R	—	—
Asset Mon	F	F	R	R	R	S	R	R	F	S	—	—
FI Master	F	F	R	R	R	R	F	R	R	R	—	—
Clients	F	F	R	—	R	—	R	—	R	—	R	R
Employees	F	F	R	R	R	R	R	R	R	R	R	R
Audit	F	—	—	—	—	—	—	—	—	—	—	—
Activity	F	—	—	—	—	—	—	—	—	—	—	—
Tools	F	R	R	R	R	R	R	R	R	R	R	R

The guiding principle: **write follows the vertical, read follows the deal.**

Two consequences that look like bugs and are not:

- **A Deal Analyst has no Leads access at all.** They can therefore *own* a lead they cannot see. That is the matrix working as specified.
- **Audit and Activity are Admin-only** — not even Management.

9. On a phone

The layout adapts: a bottom navigation bar replaces the top tabs, cards stack vertically, and action buttons fall **below** the content rather than beside it — so a reconciliation card reads *"company · what is missing · then the decision buttons"*, not decision-first.

VocX is fully usable on a phone; that is the point of it.

10. Common tasks — quick index

I want to...	Where
See what needs me today	Today
Approve something	Today → the item → Approve
Add a new company	Masters → Clients → Add , or let a VocX capture create it
Add a lead	Leads → Add
Turn a lead into a deal	Leads → the row → Push to Deals (an approval follows)
Add a product line	Deals → company → Add product
Move a stage	Deals → company → Stage change (only legal moves are offered)
Close a deal (Won / Lost / Dropped)	Deals → company → Close deal
Record a conversation	 in the header
Log a typed interaction	Deals → company → Log interaction
Upload a document	Deals → company → Data Register
Add a bank to a mandate	Platform Deals → mandate → Add lender
Chase a bank / record a response	Platform Deals → the lender row
Grant someone a role	Masters → Employees
Import a spreadsheet	Tools → Ledger → Import
Fix a failed import row	Masters → Reconciliation
Export the book	The export bar on any grid, or Tools → Ledger → Export
See who changed what	Activity (Admin)

11. When something looks wrong

Symptom	Likely explanation
A tab is missing	Your role does not have that view — §8
A button 403s	The view is visible but the <i>operation</i> is not permitted, or the row is outside your scope
A stage will not move	Not a legal transition, or the stage's mandatory data is missing — the error names the field
The Company column is blank on a grid	The row has no deal record; recent builds resolve the company from the row's own entity
A row I imported is not in the grid	It was quarantined — Masters → Reconciliation
I see the old version after a deploy	The UI is a cached bundle — hard-refresh (Ctrl+Shift+R)
An approval I gave did nothing	The workflow worker may be down — tell an operator (05 §10)
Every page shows 502	Edge-level, not you — an operator needs to reload nginx (13)
